

# REDESIGN - GITLAB REPORTS

## DESCRIPTION

GitLab Reports by Geeknauts is a fork of an existing project created by Cosango. It's a small application created to help developers (who use GitLab for their projects) generate time reports for their GitLab projects.

In this project, functionality was added to analyze separate notes in issues. This feature is designed for situations where several users are working on the same task, or one user is working on a task for a long time, and we only want to get a report for a specific period of time. Analyzing each note in a case makes the whole process of generating a report a bit longer.

### GITLAB REPORTS

#### Overview

GitLab Reports by Geeknauts is a fork of an existing project created by Cosango. It's a small application created to help developers (who use GitLab for their projects) generate time reports for their GitLab projects. Once authenticated by GitLab, developers are taken back to the GitLab Reports app, where they can select the desired project from the right sidebar to create quick project reports showing all issues logged in the selected project.

If the project has milestones, the app will also load them into a new list from which they can select the desired project to create a milestone report.

GitLab Reports supports calculation of total estimated time and total time spent on all issues in the project report. This helps developers analyze how much total time they spent on each project milestone, making it easier to track progress.

In this project, functionality was added to analyze separate notes in issues. This feature is designed for situations where several users are working on the same task, or one user is working on a task for a long time, and we only want to get a report for a specific period of time. Analyzing each note in a case makes the whole process of generating a report a bit longer.

Some of the functions have been hidden in drop-down lists so as not to overwhelm the user with the number of possibilities that do not always have to be used.

Entering data in the "Projects" tab

### GITLAB REPORTS

The expanded Advanced feature shows all the possibilities.

Entering data in the table highlights the Generate button.

Pressing Print will highlight the "to PDF" and "to Excel" options.

Entering data in the "Users" tab

### GITLAB REPORTS

Selectable user-specific options.
